

# AIIR

*We CARE about the AIIR you breathe.*

**CareHealth** Meditech

ISOLATION AND ELIMINATION OF AEROSOLIZED PARTICLES

Canadian made and manufactured, AIIR (**A**irborne **I**nfection **I**solation and **R**emoval) by Care Health Meditech delivers patent-pending local removal at source of aerosolized particles in an open environment. Additionally, AIIR provides a layered approach to your practice's droplet precautions, improving both patient and team safety and peace-of-mind.

AIIR is light and maneuverable and stays out of the way in its optimal position at the foot of the operatory dental chair. With swing-arm motion through 360 degrees, AIIR can be positioned once at the start of the day, and swung out of the field between patients to provide for easy patient ingress, egress and set-up.

Unimpeded patient access allows for "four-handed dentistry". AIIR can be operated by a solo-RDH in place of HVE, allowing for single-operator hygiene delivery.

Our patent-pending optical-head provides enhanced droplet precautions alongside aerosol capture and elimination. Optics deliver zero-refraction and unimpeded view, with or without dental loupes.

## IMPROVE EFFICIENCIES

Quiet, open and beautiful. Interactions between clinicians and patient occur as normal, and without the patient feeling restrained or claustrophobic.

Built by dentists, for dentists, AIIR steri-cycle times between patients are less than 120-seconds. Go from “out of the box”, through set-up and training, to first patient, in under an hour.

AIIR provides guidance-compliant alternatives to “between patient wait-times”.

Visit **[www.carehealthmeditech.com](http://www.carehealthmeditech.com)** and use our wait-time calculator alongside Health Canada / CDC guidance to see how wait-times could be reduced in your space. How much would a reduction of between patient wait times be worth to your practice in terms of regained opportunity cost and improved patient throughput?

**RESEARCH AND DEVELOPMENT**

With a corporate vision of “reshaping global healthcare infection control measures” Care Health Meditech Research and Development is completed in partnership with the University of British Columbia and NSERC - Natural Sciences Engineering and Research Council of Canada (research proposal).

IT'S MORE THAN CLEAN AIR

Develop competitive advantage in your practice today.

Consumer and patient fear and anxiety surrounding aerosols created during dental procedures is high, and accelerating. As patient and team anxiety climbs, it can deter or defer attendance.

Incorporating patient and team briefings on the benefits of AIIR, both in-practice, in the media, on social media, and within your digital marketing SEO / SEM strategy can reduce patient and team anxiety, increase peace of mind, and help you stand out.
